To use AutoCAD effectively, users must understand its graphics environment, input commands, and the design and drafting process. This article summarizes concepts that are often misunderstood by novice users and explains how to avoid these mistakes. The AutoCAD Graphics Environment The AutoCAD user interface consists of a number of windows, each with its own input area. The main window is the work area. In this window, you input commands and add objects. The information that you enter is stored as a drawing file. Each time you open a drawing file, you load a drawing from the file into the work area. You can continue to edit the drawing in the work area, or you can use the command line to modify the drawing directly. A drawing is a graph of objects called blocks, where each block represents an element, feature, or object within a drawing. A block is an autonomous entity that can perform various tasks on its own. For example, a room-block can draw walls, room-blocks can draw windows and doors, and so on. This article refers to the objects that AutoCAD has available as blocks, not to the actual objects within a drawing. The following drawing shows an example of a 2D drawing with blocks. The AutoCAD Graphics Environment An object is created in the Drawing window by placing it within a block, a figure, or a freeform drawing area. A figure is a generic type of object that may include a variety of geometric shapes. Blocks are specifically listed in the Drawing block set, along with the commands and properties that you can use when you create them. The properties are either stored on the block or on the figure it's attached to. (See Figure 1-2.) Figure 1-2. A figure with its properties stored on it Figure 1-3. There are other command-line tools that are not discussed in this article but that are available for use with AutoCAD. AutoCAD provides a standard set of commands for you to use in most instances, such as the commands for adding, modifying, and removing blocks, figures, and lines. Figure 1-5 shows the Input toolbar. Now here we are over 3 years later and I am so happy to be a part of the Idaho Women Bloggers. There are so many amazing blogs out there and it is a great group of ladies who are all so supportive. This week I decided to pick a random person from the list and it turned out to be one of my best friends! We were introduced at church and have been friends for 13 years now. The authors report the case of a man who, from childhood, complained of right recurrent parotiditis and persistent hypergammaglobulinaemia associated with hepatitis. The chronic course of hepatitis without any other detectable cause (infectious, metabolic, toxic, genetic,...) suggested a viral cause. A lymphocytic choriomeningitis virus was isolated from the parotid fluid and a coronavirus from the blood. The patient did not respond to immunosuppressive drugs. The treatment consisted of methylprednisolone for three months followed by prednisone. During the course of therapy, an attempt at spontaneous remission was followed by a relapsed hepatitis. Treatment with prednisone was started again. A third treatment was required before the patient was considered to be in remission. Then, it was possible to discontinue prednisone. For six years, the patient has been asymptomatic without any signs of recurrence. This case shows that in chronic viral hepatitis, a chronic course with recurrent parotitis might be associated, possibly because of a viral cause. This could represent a part of the "viral syndrome" also called "postinfectious syndrome". The diagnosis should therefore be systematically suggested. Immunosuppressive treatment should not be started.
